

PUBLIC HEALTH REPORTS

VOL. 32

SEPTEMBER 21, 1917

No. 38

EXTRA CANTONMENT ZONE REGULATIONS.

REGULATIONS GOVERNING THE SALE OF FOODSTUFFS IN THE ZONE AROUND CAMP DIX, WRIGHTSTOWN, N. J.

On September 4, 1917, the State Board of Health of New Jersey adopted the following regulations, which constitute Chapter VII of the State Sanitary Code of New Jersey.

REGULATION 1.—*Zone around Wrightstown Cantonment defined.*—The provisions of the following regulations shall apply to all premises which lie within a distance of 7 miles in a direct line from the Penberton-Hightstown Railroad station at Wrightstown and to all persons who conduct any of the businesses referred to in regulation 2 of this chapter within such distance, exclusive of the land included in the National Army cantonment known as Camp Dix and located in Burlington County.

REGULATION 2.—*Permits required to sell food and beverages.*—No person shall establish or conduct any hotel, boarding house, restaurant or eating house, lunch counter, stand, vehicle, store, delicatessen, or other place of business for the sale or distribution of food or drink intended for human consumption on the premises unless such person shall first have secured from the director of health or from his duly authorized representative a written permit so to do; and no person, without first having secured a permit as herein provided, shall establish or conduct any grocery store, market, or other place of business for the sale or distribution of any food or drink which is prepared for human consumption without further cooking unless such food or drink is received, stored, sold, and distributed in sealed packages or containers which will effectually protect such food or drink from contamination. Such permit, unless revoked, shall be good for one year and shall be conspicuously displayed in the place of business for which it was issued. Permits issued under these regulations are not transferable.

REGULATION 3.—*Permits only issued after laws and regulations complied with.*—No permit shall be issued under regulation 2 for the conduct of any of the businesses referred to in said regulation unless the building, room, stand, vehicle, or place in which it is proposed to conduct such business, together with the yard and appurtenances thereto, have been made to conform in all respects to the requirements of the existing State laws relating to the conduct of such business and to the provisions of regulations 1, 2, 3, 4, 5, and 6 of Chapter I of the State Sanitary Code, and to all rules and regulations of the State department of health; provided, however, in the case of businesses already established at the time these regulations become effective, the persons conducting such businesses shall, within 10 days thereafter, secure a permit as provided for in regulation 2.

REGULATION 4.—*Permits revocable for cause.*—The violation of any of the provisions of the existing State laws or of any of the provisions of regulations 1, 2, 3, 4, 5, and 6 of Chapter I of the State Sanitary Code, or of any rule or regulation of the State depart-

ARE YOU SAYING Your Money to Invest in the SECOND LIBERTY LOAN?

ment of health, by any person holding a permit issued under authority contained in these regulations, shall be deemed sufficient cause for the revocation of such permit by the director of health or his duly authorized representative.

REGULATION 5.—The regulations contained in Chapter VII of the State Sanitary Code shall take effect on the 4th day of September, 1917.

THE NOTIFIABLE DISEASES.

PREVALENCE DURING 1916 IN STATES.

ANTHRAX, DIPHTHERIA, DENGUE, MALARIA, MEASLES, MENINGITIS, POLIOMYELITIS, RABIES IN MAN, ROCKY MOUNTAIN SPOTTED FEVER, SCARLET FEVER, SEPTIC SORE THROAT, SMALLPOX, TUBERCULOSIS (PULMONARY), TUBERCULOSIS (ALL FORMS), TYPHOID FEVER, AND TYPHUS FEVER—CASES AND DEATHS REPORTED, INDICATED CASE RATES PER 1,000 POPULATION, INDICATED FATALITY RATES PER 100 CASES, AND INDICATED MORTALITY RATES OF DIPHTHERIA, MEASLES, SCARLET FEVER, TUBERCULOSIS (PULMONARY), TUBERCULOSIS (ALL FORMS), AND TYPHOID FEVER, PER 1,000 POPULATION.

Pursuant to the practice that has been carried out for a number of years schedules were sent on January 15, 1917, to the health officers of the several States. The data of the prevalence of disease contained in the following tables have been compiled from the schedules returned by the several State health officers and registrars. While not all of the States returned the schedules, the failure to do so was perhaps in all instances due to the fact that the necessary data were not available.

The absence of figures in the "deaths" column in the tables may mean that no deaths occurred or that the data as to deaths were not furnished by the State authorities having jurisdiction.

The populations used in computing the case rates were those estimated by the Bureau of the Census as of July 1, 1916.

It will be noted that some of the States are apparently more successful in obtaining reports of the occurrence of the notifiable diseases than are others. This may be due to the greater activity of their health departments or to a more intelligent interest in the public welfare on the part of their practicing physicians. The effective grasp of the control of disease possessed by the health departments in certain States is indicated in a number of instances by the large numbers of cases reported as compared with the numbers of deaths registered from the same causes.

The manner of collecting data of the prevalence of disease in Mississippi and Virginia differs from that employed in the other States, and the results, though included in the tables which follow, can not be considered as strictly comparable with those of the other States. This difference is brought out, for example, by the large number of cases of malaria reported in Mississippi and Virginia. Malaria is probably no more prevalent in these States than it is in Louisiana and South Carolina. In Mississippi the regulations specify

ARE YOU SAVING Your Money to Invest in the SECOND LIBERTY LOAN?

that physicians shall report to the county health officer on the first day of each month the number of cases of the notifiable diseases which occurred in their practices during the preceding month. In Virginia the reports are made in the same way. Presumably these reports are made out in many instances by the physicians from memory and not from case records. In Mississippi the regulations specify that physicians shall also report to the county health officers within 24 hours cases of diphtheria, epidemic cerebrospinal meningitis, acute poliomyelitis, rabies, smallpox, and typhoid fever. These immediate reports are in addition to the monthly reports. Tuberculosis is required by law to be reported within seven days to the State board of health and ophthalmia neonatorum within six hours to the local health officers. The records of these diseases in Mississippi are probably, therefore, comparable with data for the other States.

In relation to Rocky Mountain spotted fever, a special survey was made by Surg. Fricks, who reported cases, located by States, during the calendar year 1916 as follows: California 11, Colorado 5, Idaho 151, Montana 19, Nevada 20, Oregon 26, Utah 29, Washington 3, and Wyoming 26, making a total of 290¹ cases in the far Western and Northwestern States.

The tables ² contain data furnished by and relating to the following States:

Alabama.	Louisiana.	Ohio.
Arizona.	Maine.	Oregon.
California.	Maryland.	Pennsylvania.
Colorado.	Massachusetts.	Rhode Island.
Connecticut.	Michigan.	South Carolina.
District of Columbia.	Minnesota.	Vermont.
Hawaii.	Mississippi.	Virginia.
Indiana.	Montana.	Washington.
Iowa.	New Jersey.	Wisconsin.
Kansas.	New York.	Wyoming.

DENGUE.

A case of dengue was reported during the year in Arizona, 5 cases were reported in Hawaii, and 969 cases in Texas. The Texas outbreak occurred during the last five months of the year, reaching its maximum during September.

¹ The cases reported in the schedules of the States will be found in the table on page 1519.

² In studying these tables it should be kept in mind that a relatively large number of reported cases of a communicable disease, as indicated by a high case rate (and more especially when accompanied by a relatively small number of deaths, as indicated by a low fatality rate), usually means that the health department of that State is active and that the cases of the disease are being properly reported by the practicing physicians. It does not necessarily mean that the disease is more prevalent in that State than in other States. A high fatality rate may mean that the disease was unusually virulent in a State, that the physicians did not treat the disease in that State with the success usual elsewhere, or that the practicing physicians did not report all of their cases. On the other hand, an unusually low fatality rate may be due to the fact that the disease in the State was unusually mild, that the physicians treated it with unusual success, that the practicing physicians reported their cases satisfactorily, or that the registration of death was incomplete, or the assignment of the causes of death inaccurate.

PREVALENCE OF DISEASE.

No health department, State or local, can effectively prevent or control disease without knowledge of when, where, and under what conditions cases are occurring.

UNITED STATES.

CURRENT STATE SUMMARIES.

California Report for the Week Ended September 15, 1917.

CURRENT STATE SUMMARIES.

California Report for the Week Ended September 15, 1917.

The California State Board of Health reported concerning the status of preventable diseases in California for the week ended September 15, 1917, as follows: Three cases of smallpox were notified in the State, 1 in Fresno County and 2 in the city of San Francisco. The numbers of cases of diphtheria, scarlet fever, and whooping cough indicated increases in the prevalence of those diseases. Of 28 cases of diphtheria notified, 13 were in San Francisco and 6 in Los Angeles. Forty cases of typhoid fever were notified during the week. The prevalence of other notifiable diseases continues about the same as during the previous week.

The details of notifiable disease cases reported during the week ended September 8, 1917, are as follows:

Cerebrospinal meningitis.....	1	Mumps.....	44
Chicken pox.....	26	Pneumonia.....	25

TYPHOID FEVER.

Indiana—South Bend—Outbreak.

September 17 a report was received of the existence of an outbreak of typhoid fever at South Bend, Ind. Surgeon Cobb of the United States Public Health Service was immediately ordered to South Bend with the laboratory car, Wyman, and its complete personnel.

ARE YOU SAVING Your Money to Invest in the SECOND LIBERTY LOAN?

TYPHOID FEVER—Continued.

Surgeon Cobb reported September 19 that 88 cases of typhoid had been reported since September 1. The first group of cases was reported September 12. Of the cases 76 were reported during the 7 days September 13 to 19.

Kansas—Leavenworth County.

During the week ended September 15, 1917, 5 cases of typhoid fever were notified in Leavenworth County, Kans., making a total of 216 cases reported in the county, including the city of Leavenworth, since January 1, 1917.

Mississippi—Moselle.

During the period from September 2 to 13, 1917, 22 cases of typhoid fever were notified at Moselle, Jones County, Miss. Moselle has a population of about 250.

Tennessee—Chattanooga and Vicinity.

During July there were reported to the health department of Chattanooga 25 cases of typhoid fever, during August 71 cases, and during the first 7 days of September 2 cases. This number of cases in a city the size of Chattanooga constituted an unusual prevalence. The following conclusions are taken from the report of Surg. L. L. Lumsden, of the Public Health Service, who investigated the outbreak: That there was in Chattanooga in July and August of 1917 an unusually high prevalence of typhoid fever constituting not what should be regarded as a "severe epidemic" but which may be conveniently designated as an "acute outbreak"; that the outbreak began about July 15, and practically terminated by August 15; that from August 15 to September 7 the occurrence of typhoid fever in Chattanooga had not been in excess of the usual local rate for this period of the year; that in the period of the outbreak there developed in the city from locally spread infection about 75 cases in excess of the average number for corresponding periods of the last several years; that the period of causation of the outbreak was between June 25 and August 1, with its maximum between July 10 and July 20.

The outbreak of typhoid fever in Chattanooga in July and August of 1917 may have been contributed to by scattering cases caused by infection conveyed by various agents from various sources, but the vast majority of the cases constituting the excess or the outbreak proper were beyond reasonable doubt caused by infection distributed through ice cream, the principal ingredients of which were prepared and distributed from one of the dairy and ice-cream establishments in the city of Chattanooga.

TYPHOID FEVER—Continued.

In a densely settled section, geographically continuous with the city of Chattanooga but outside the incorporated limits of the city, known as "East Lake," typhoid fever was found to be highly prevalent. In a population of about 2,500, over 30 cases were known to have occurred in the months of July and August. According to the evidence obtained it appeared that the typhoid fever in East Lake had resulted largely from local insanitary conditions in respect to the disposal of human excreta. At most of the homes open insanitary privies were in use and at the remainder there were cess-pools or poorly constructed and poorly operated "septic tanks." East Lake is on the road between Fort Oglethorpe and Chattanooga.
